

Watlington Air Quality

NO₂ Monitor at Town Hall

The Town Hall monitor records the average NO₂ concentration for each hour throughout the day as in indication of the level of air pollution. The unverified results are shown below in comparison with the EC hourly and annual objectives for air quality. The monthly average was 35.1 µg/m³, lower than last month and below the annual objective. The monthly average follows the same trend as last year with lower levels in summer, but this year is higher than last. The annual average to date (43.6) however remains above the objective. The hourly objective was not exceeded during August.
