

Watlington Air Quality

NO₂ Monitor at Town Hall

The Town Hall monitor records the average NO₂ concentration for each hour throughout the day as an indication of the level of air pollution. The monthly average for May was 32.6 µg/m³ which is the lowest May average for five years and is probably a consequence of the sunny hot weather this year. The average for the year to date is 38.3 µg/m³ which is below the annual objective. There were no hourly exceedances during April.

The monitor failed to record about 4% of the hourly values in May.
