## NO<sub>2</sub> Monitor at Town Hall

The Town Hall monitor records the average NO<sub>2</sub> concentration for each hour throughout the day as an indication of the level of air pollution. The monthly average for June was 26.2 µg/m<sup>3</sup> which is the lowest of the range of May values since recording was started. The level for the half of the year was 29.0 µg/m<sup>3</sup> which is low. There were no hourly exceedances during the month. The monthly average graph below shows the ratified levels for 2017 and previous years, and the provisional levels for 2018.

The raid on the Co-op on 21st June provides a graphic illustration of the benefit of removing traffic from Couching Street - see the clean air day graph.
